Maximize c^T x subject to Ax ≤ b, x ≥ 0;

Minimize b^T y subject to A^T y ≥ c, y ≥ 0.

Maximize c^T x subject to Ax ≤ b;
with the corresponding asymmetric dual problem,
Minimize b^T y subject to A^T y = c, y ≥ 0.

Maximize \sum x subject to x_i + x_j ≤ Aij, x ≥ 0;
=> Maximize \sum x subject to x_i + x_j ≤ A_ij;
=> Minimize A^T y = \sum A_ij y_ij subject to for all v,
\sum_{i=v or j=v} y_ij = 1, y_ij ≥ 0
=> possible optimal solution: y_ij = {0, 0.5, 1}
=> y'=2y: \sum_{i=v or j=v} y'_ij = 2, y'_ij = {0, 1, 2}
=> Minimum Bipartite perfect matching/2 (V1=X,V2=X,E=A)

General Graph:
|Max Ind. Set| + |Min Vertex Cover| = |V|
|Max Ind. Edge Set| + |Min Edge Cover| = |V|
Bipartite Graph:
|Max Ind. Set| = |Min Edge Cover|
|Max Ind. Edge Set| = |Min Vertex Cover|

To reconstruct the minimum vertex cover, dfs from each
unmatched vertex on the left side and with unused edges
only. Equivalently, dfs from source with unused edges
only and without visiting sink. Then, a vertex is
chosen iff. it is on the left side and without visited
or on the right side and visited through dfs.

Minimum Weighted Bipartite Edge Cover:
```

```
Construct new bipartite graph with n+m vertices on each
side:
for each vertex u, duplicate a vertex u' on the other side
for each edge (u,v,w), add edges (u,v,w) and (v',u',w)
for each vertex u, add edge (u,u',2w) where w is min edge
connects to u
then the answer is the minimum perfect matching of the new
graph (KM)

Maximum density subgraph ( \sum{W_e}+ \sum{W_v} ) / |V|
Binary search on answer:
For a fixed D, construct a Max flow model as follow:
Let S be Sum of all weight( or inf)
1. from source to each node with cap = S
2. For each (u,v,w) in E, (u->v,cap=w), (v->u,cap=w)
3. For each node v, from v to sink with cap = S + 2 * D -
deg[v] - 2 * (W of v)
where deg[v] = \sum weight of edge associated with v
If maxflow < S * |V|, D is an answer.

Requiring subgraph: all vertex can be reached from source
with
edge whose cap > 0.

Maximum closed subgraph
1. connect source with positive weighted
vertex(capacity=weight)
2. connect sink with negitive weighted vertex(capacity=-
weight)
3. make capacity of the original edges = inf
4. ans = sum(positive weighted vertex weight) - (max flow)

Let i = number of points inside the polygon.

Let b = number of points on the boundary of the polygon.

Then we have the following formula:
